Module 5: Domains and Their Interconnections

Emergent Ideas

Three dimensional diagram of Earth's orbit around the sun:

The earth is shown at four points along the orbit. At each point, the earth is tilted at an angle on its axis such that at some points the North Pole is closer to the sun than the South Pole, and sometimes farther away. The axis also indicates that the earth is rotating around its axis even as it orbits the sun. The sun lights up the side of the earth closest to it, while the other side is dark.
